

Attachment A – The Bower Site Photographs

Note: The Phase 1 sculpture procurement is being conducted coincident with finalization of the overall project master plan. Landscape and gardens represented in these photographs are not complete. Artwork selection, design and installations will be conducted in collaboration with the Owners as the master plan is implemented.

Figure 1: The Bower will consist of 6 acres of landscaped gardens interspersed with naturalized meadow enclosed on all sides by a towering deciduous hardwood stand that changes seasonally. The lavender allee' leads to one of the primary sculpture locations.

Figure 2: On left a southern view of tall meadow, turf allee' and mature trees framing a "long view" suitable for larger scale artwork that will be visible from multiple locations on the site. The right photo looking southwest across our newly developed Ellipse Garden shows the same a corner site from a different perspective.

Figure 3: A northeastern view balances skyscape with tree canopy and shows an example of a meadow pathway. This view is from the location highlighted in Figure 2 and also represents a long view suitable for large artworks.

Figure 4: These three perspectives show the location for a small minimalist “glass house” structure proposed as a key architectural feature of the site. The facility will be designed to serve multiple functions including intimate temporary gallery and event space.

Figure 5: Several gardens are emerging throughout the grounds and will be accompanied by many more as the project develops. Artists will be invited to work with designers and landscapers to create complimentary settings for their work.

Figure 6: The existing residence hardscaping includes gabion walls and pedestals suitable for a collection telling a story and a pool area suitable for multiple pieces.

Figure 7: Woodland pathways will traverse varied ecosystems, on the left waves of fern that accompany a rainy summer. The woodland extends to a north facing mountain slope riddled with moss and lichen laden weathered rocks. On the right snow cover, lest we forget the seasonal nature of the site.
